

LIGHT EMITTING ASSEMBLY

ABSTRACT OF THE DISCLOSURE

A light emitting assembly having a first light source and a second light source. The first and second light sources are oriented such that when the first and second light sources emit light, light emitted from the first and second light sources overlaps and is capable of forming effective white light. The light emitted from the first light source exhibits color coordinates different from the light emitted from the second light source. One of the light sources may be a photoluminescent source, such as a fluorescent dye or phosphor.
